SPRING FRAMEWORK GURU

## Use SQL to Create Database Tables

- Create classic - 'Author' / 'Book' example, where the Author has many books.

  - Don't worry about multiple authors per book. (applying the K.I.S.S. principle)

- Author should have the following properties: first name, last name, email, phone, website, date created, date updated.

- Book should have the following properties: title, subtitle, description, ISBN, price, date created, date updated.

- Follow best practices - use primary key, auto-increment, proper data types.

- ISBN is unique and should be enforced.
